MISSISSIPPI STATE DEPARTMENT OF HEALT 2013 JUN 24 AM 9: 24 BUREAU OF PUBLIC WATER SUPPLY CCR CERTIFICATION FORM CALENDAR YEAR 2012

	Double Springs Water AssN Public Water Supply Name
	List PWS ID #s for all Community Water Systems included in this CCR
The Con syste of electric check	Federal Safe Drinking Water Act (SDWA) requires each Community public water system to develop and distribute a sumer Confidence Report (CCR) to its customers each year. Depending on the population served by the public water em, this CCR must be mailed or delivered to the customers, published in a newspaper of local circulation, or provided to the omers upon request. Make sure you follow the proper procedures when distributing the CCR. Since this is the first year lectronic delivery, we request you mail or fax a hard copy of the CCR and Certification Form to MSDH. Please the All boxes that apply.
X	Customers were informed of availability of CCR by: (Attach copy of publication, water bill or other)
•	Advertisement in local paper (attach copy of advertisement) On water bills (attach copy of bill) Email message (MUST Email the message to the address below) Other
	Date(s) customers were informed: 5/28/13, //, //
	CCR was distributed by U.S. Postal Service or other direct delivery, Must specify other direct delivery methods used
	Date Mailed/Distributed://
	CCR was distributed by Email (MUST Email MSDH a copy) As a URL (Provide URL As an attachment As text within the body of the email message
X	CCR was published in local newspaper. (Attach copy of published CCR or proof of publication)
	Name of Newspaper: Starkville Daily News
	Date Published: 5 / 11 / 13
	CCR was posted in public places. (Attach list of locations) Date Posted:/

2012 Annual Drinking Water Quality Report Double Springs Water Association PWS#: 0530008 May 2013

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water. Our water source is from wells drawing from the Gordo Aquifer.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Double Springs Water Association have received lower to moderate susceptibility rankings to contamination.

If you have any questions about this report or concerning your water utility, please contact Wayne Dewberry at 662.263.5009. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the first Monday of the quarter at 7:00 PM at the Community Center.

We routinely monitor for constituents in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1st to December 31st, 2012 In cases where monitoring wasn't required in 2012, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to remember that the presence of these constituents does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

^{*} Most recent sample. No sample required for 2012

Microbiological Contaminants:

(1) Total Coliform. Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria may be present. Coliforms were found in more samples than allowed and this was a warning of potential problems. Disinfection By-Products:

Chlorine. Some people who use water containing chlorine well in excess of the MRDL could experience irritating effects to their eyes and nose. Some people who drink water containing chlorine well in excess of the MRDL could experience stomach discomfort.

Monitoring Violation

We are required to monitor your drinking water for specific contaminants on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During May 2012, 1 routine bacteriological sample tested positive for total coliform. The law requires that valid resamples be collected for each positive routine sample within 24 hours. We collected the required resamples in a timely manner, however due to a clerical error the sample paperwork was improperly completed. This caused our system to not receive credit for the three resamples collected. Also we are required to collect chlorine samples on each bacteriological compliance sample. We did not complete all chlorine sampling during that time, therefore we cannot be sure of the quality of our drinking water during that time. We have since taken all required samples and the system has been returned to compliance.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our Water Association is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

*****April 1, 2013 MESSAGE FROM MSDH CONCERNING RADIOLOGICAL SAMPLING*****

In accordance with the Radionuclides Rule, all community public water supplies were required to sample quarterly for radionuclides beginning January 2007 – December 2007. Your public water supply completed sampling by the scheduled deadline; however, during an audit of the Mississippi State Department of Health Radiological Health Laboratory, the Environmental Protection Agency (EPA) suspended analyses and reporting of radiological compliance samples and results until further notice. Although this was not the result of inaction by the public water supply, MSDH was required to issue a violation. This is to notify you that as of this date, your water system has completed the monitoring requirements and is now in compliance with the Radionuclides Rule. If you have any questions, please contact Karen Walters, Director of Compliance & Enforcement, Bureau of Public Water Supply, at 601.576.7518.

The Double Springs Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

REUE WEUT WAILIN

MUPPLY

We're pleased to present to you this year's Annual Quality (Vater Report, This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water, Out water source is from wells drawing from the Gordo Aquilier.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified patential sources of contamination. A report containing detailed information on from the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Double Springs Water Association have received lower to moderate susceptibility rankings to contamination

If you have any quastions about this report or concoming your water utility, please contact Wayne Dawberry at 662.263.5009. We want our valued customers to be informed about their water utility. If you want to fearn more, please attend any of our regularly scheduled meetings. They are held on the first Monday of the quarter at 7:00 PM at the Community Center.

We routinely monitor for constituents in your drinking water according to Faderat and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1st to Decamber 31st, 2012, in cases where monitoring wasn't required in 2012, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, addisactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as wiruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as asits and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater. contaminants, such as sells and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, of demestic wastewater discharges, oil and gas production, mining, or farming, posticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; aganic chemical contaminants, including synthetic and valatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or to the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the emount of cartain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some constituents. It's important to mmember that the presence of those constituents does not recessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

el - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Conteminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a conteminant that is allowed in drinking water. MCLs are set as close to the MCLGs as leasible using the best available treatment technology.

Maximum Contambant Level Goal (MCLG) - The "Goor(MCLG) is the level of a contaminant in drinking water below which there is no known of expected risk to health. MCLGs allow for a margin of safety.

Meximum Residual Disinlectant Loval (MRDL) - The highest level of a disinfectant allowed in drinking water. There is consincing existence that addition of a disinfectant is necessary for control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contembants.

Parts per million (ppm) or Milligrams per lifer (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.
